Ohio Crop Reporting Service

Columbus, Ohio

INTRODUCTION

This issue of Ohio Agricultural Statistics summarizes virtually all series of agricultural statistics published by the Ohio Crop Reporting Service, U. S. D. A. during the 1959-1965 period. It is the second in a series which provides final revised estimates by county for major agricultural commodities. In addition, statistical data published by the U.S. Weather Bureau, Economic Research Service, and the U. S. Census Bureau are included in this bulletin. Current estimates for crops, livestock, prices, cash receipts and county estimates for major commodities are available free of charge upon request to Agricultural Statistician, 217 Old Federal Building, Columbus, Ohio 43215.

The tables presented are basically the same as those presented in Ohio, Agricultural Statistics, Research Bulletin 933, which was issued in March 1963 and covered the period 1954-1960. However, this issue has been expanded to include additional pertinent information and additional charts have been included to give a quick visual comparison of trends in the overall picture. State estimates cover the period 1960-1965 with a few exceptions. Charts shown for livestock items cover a longer period of time in order to better show trends in the livestock numbers.

Estimates of acreage, yield per acre, total crop production, number of livestock on farms and value of commodities are based largely on data furnished by voluntary reporters to the Ohio Crop Reporting Service.

ACKNOWLEDGMENTS

Our appreciation is extended to the postmasters and rural carriers for distributing and collecting survey questionnaires; also to the large number of Ohio farmers and Agribusinessmen for their interest and help in providing the basic data used in preparing the estimates presented in this bulletin.

Robert L. Griffith, Agricultural Statistician, Ohio Crop Reporting Service assembled the materials, and supervised the preparation of data and charts for this publication, "Ohio Agricultural Statistics." The author would like to thank the typing staff of the Agricultural Economics Department at Ohio State University and the Editorial Staff at the Ohio Agricultural Research and Development Center at Wooster for their fine cooperation in completing this bulletin. Photos were furnished by the O. A. R. D. C. and the Extension Service at Ohio State University.

OHIO CROP REPORTING DISTRICTS

Counties with similar types of farming, soil, and climate are combined into 9 crop reporting districts. This aids in interpreting reported data from farmers and others, and in making calculations of State estimates.

OHIO'S AGRICULTURAL PRODUCTION

Ohio's agricultural production, measured in terms of cash receipts, increased most years from 1959 to 1965 for virtually all items. Food grains was the only commodity group with smaller cash receipts in 1965 than 1959 due largely to a decrease in the price of wheat. Cash receipts from all crops increased each year except 1961 and 1965 from 359.1 million dollars in 1959 to 441.9 million dollars in 1965. The largest increase in cash receipts for crops during this period came from oil bearing crops (soybeans) which moved from 75.6 million dollars to 115.1 million dollars due to both an increase in production and price. Cash receipts from livestock and livestock products increased each year during the period except 1963 moving from 581.2 million dollars in 1959 to 671.5 million dollars in 1965. The largest increase during the five year period came in meat animals and was due to increased prices since the index of meat animal production for 1965 was only 95 percent of the 1947-49 base compared to 101 percent in 1959. This index reached a high of 105 percent in 1964 which was the same year that the meat animal index of prices received reached the low of 233 percent for the 5-year period.

1/ Persons employed during the last full calendar week ending at least one day before the end of the month.

2/ Includes farm operators doing one or more hours of farm work and members of their families working fifteen hours or more during the week without cash wages.

3/ Includes all persons doing one or more hours farm work during the week for pay.

FARM WAGE RATES: Wages paid by Ohio farmers for hired labor increased as the number of workers declined from 1959 to 1965. The monthly wage with room and board increased ten percent from January 1959 to January 1965. The monthly rate with house increased 15 percent for the same period. The daily rate with room and board increased during this period only three percent while the daily rate without room and board moved up six percent from January 1959 to January 1965. The rate per hour in January 1965 without room or board was six percent above the January 1959 rate.

REAL ESTATE VALUES

Farm real estate values continued to climb to new record high levels. Between 1960 and 1965 the average value of farmland increased from \$248 per acre to \$294 per acre. This raised the total value of all farm real estate from \$4.5 billion to \$5.1 billion and the average value per farm from \$30,510 to \$41,145 during the same period. The index numbers of the average value per acre shows the 1965 value at 125 percent of the 1957-1959 base in March and 131 percent of the same base in November.

INDEXES OF OHIO AGRICULTURAL PRODUCTION AND PRICES RECEIVED

Index number series are measures of changes in agricultural production and prices. Procedures used in computing the index number for Ohio are about the same as used in computing National indexes. However, some differences, peculiar to Ohio, have been considered.

Agricultural Production

Production index numbers for Ohio are computed for two major commodity groups, Crops and Livestock. These groups are further divided into eleven sub-groups. This allows productivity of the smaller commodity sub-groups to be inspected and compared. The production index numbers are available starting with 1924 and were computed using the base period of 1947-1949 as being equal to 100.

The All Crop Production Index numbers include 39 different crops produced in Ohio.

They are grouped into eight classifications:

- | | |
|-----------------|---|
| (1) Feed Grains | (5) Seed Crops |
| (2) Wheat | (6) Vegetables |
| (3) Hay | (7) Fruits |
| (4) Soybeans | (8) Other Field Crops, which includes popcorn, sugar beets, maple products, potatoes and tobacco. |

The All Livestock Production Index numbers are divided into three sub-groups:

- (1) Meat Animals
- (2) Dairy Products
- (3) Poultry and Eggs

In computing the All Livestock Production Index numbers, the price-quantity aggregates of honey, beeswax and wool were included with total from the above three sub-groups.

Prices Received

Prices Received Index Numbers are computed for the two major commodity groups, Crops and Livestock, using the base period of 1910-1914 as being equal to 100. The price index numbers for Ohio are available by months beginning with January 1910. However, due to limited space, only the annual average index numbers from 1955 to 1965 are presented in this bulletin. The Crop and Livestock groups are further divided into ten sub-groups. The sub-groups include 36 commodities which account for over 95 percent of the total cash receipts from farm marketings by Ohio farmers.

OHIO FARM PRODUCTION: INDEX NUMBER OF CROPS, LIVESTOCK, AND LIVESTOCK PRODUCTS, BY GROUPS, OHIO 1955-1965

WEATHER

With all of the technological improvements in seeds, fertilizer, and cropping practices, production of most crops is still determined to a large degree by the one uncontrollable factor, the weather. The following tables are official U. S. Weather Bureau data and are included because of the impact that precipitation has on crop production. The tables present monthly and annual precipitation as a percent of normal by Weather Bureau Divisions, which are shown in the map. Using 100 percent as normal for the month or year, these tables provide an easy comparison of precipitation received by division. A detailed bulletin of Weather Bureau data is available on request from the State Climatologist at Columbus.

CROPS

Production of most field crops increased during the 1959-1965 period despite the fact that acreages of all except soybeans decreased during this period. Ohio's corn for grain acreage, which accounts for about one-third of the total field crop acreage, dropped sharply from 3.4 million acres in 1960 to 2.5 million acres in 1961 as a result of the Feed Grain Program, but climbed back steadily to 3.1 million acres in 1964. Corn yield continued its upward trend, reaching a high of 78.0 bushels per acre in 1963. Total acres harvested for hay remained relatively constant during the period although the acreage shifted significantly to alfalfa from clover-timothy hay. Soybean acreage increased 40 percent from 1959 to 1965 and each year increased except 1963. Soybean yield per acre showed a range of only 5.5 bushels during the period. Acreage of oats continued to decline from 1,100,000 acres in 1959 to a low of 606,000 acres in 1965. Winter wheat acreage increased from 1.3 million acres in 1959 to a high of 1.5 million acres in 1961 and dropped back to 1.2 million acres in 1962, the lowest during the period.

1/ Corn for all purposes includes hogged and siloed corn, that cut and fed without removing the ears, as well as that harvested for grain. The yield for grain with allowance for varying yields of corn for other purposes, is applied to the total acres to obtain an equivalent production expressed in terms of grain.

2/ Includes corn hogged, grazed and that cut and fed without removing the ears.

3/ Estimates of yield and production of all corn discontinued after 1960.

OHIO WHEAT VARIETY SURVEY - 1964 CROP

Monon wheat accounted for 31 percent of Ohio's acreage planted to wheat for harvest in 1964 according to the Ohio Crop Reporting Service. A survey of 3,400 wheat growers showed that Monon has replaced Seneca (the 1959 favorite) as the most popular wheat variety in Ohio. Monon is a short strawed, high yielding, and an early maturing variety developed at Purdue University. It is most popular in the western third of the State and averaged 39 bushels per acre for all reports. Vermillion, Seneca, Dual and LaPorte followed Monon in that order and these five varieties accounted for 80.5 percent of the planted acreage.

Vermillion wheat moved into second place in 1964 with 17.7 percent of the planted acreage. In 1959, Vermillion accounted for seven percent of the planted acreage. It is a moderately early variety of medium height and excellent quality. All reports of Vermillion wheat averaged 34.9 bushels per acre for the State.

Seneca, which was the most popular wheat in both 1954 and 1959, dropped from almost one-half of the planted acreage in 1959 to 17.5 percent of the 1964 acreage. It is an excellent quality wheat, although susceptible to scab and loose smut. Seneca is still the most popular variety in the eastern third of Ohio. The reported average yield for the State for Seneca was 31.6 bushels per acre.

OATS:

Acres of oats harvested for grain dropped from 1.1 million acres in 1959 to 606,000 acres in 1965. The only increase in acreage came in 1962 which was up 12 percent from the 1961 acreage. The yield per acre of oats was quite variable during the period depending on the weather in each growing season. The highest yielding crop was in 1963 which averaged 65 bushels per acre for a total crop of 49.9 million bushels. The second highest yielding year was in 1960 which average 63 bushels per acre for the largest crop during the period of 64.4 million bushels. The season average price per bushel of oats was relatively stable during the period ranging from the low of 62 cents in 1960 to the high of 68 cents per bushel in 1965.

BARLEY:

Acres of barley harvested for grain decreased from 59,000 acres in 1959 to only 16,000 acres in 1965. Yield per acre of barley moved from the low of 31.0 bushels per acre in 1959 to the high of 43.0 bushels per acre which was reached in 1960, 1961, and 1965. Total production moved from 1.8 million bushels in 1959 up to a high of 2.3 million bushels in 1960 and decreased steadily to the 1965 production of 688,000 bushels. The season average price of barley ranged from a low of 80 cents in 1961 to a high of 89 cents per bushel in 1965.

RYE:

Acres of rye harvested for grain declined during the 1959-1965 period from 24,000 acres in 1959 to 18,000 acres in 1965. However, acres of rye planted for all purposes increased during the same period from 92,000 acres to 116,000 acres in 1965. Yield per acre during the period ranged from the low of 20.0 bushels per acre in 1959 to the high of 29.0 bushels per acre in 1963 with the largest total crop harvested in 1962 of 728,000 bushels. Season average price per bushel ranged from the low of 95 cents per bushel in 1960 to the 1963 high of \$1.05 per bushel.

OFF-FARM GRAIN STORAGE:**CAPACITY OF OFF-FARM GRAIN STORAGE FACILITIES, OHIO
AND THE UNITED STATES, JANUARY 1, 1961-1965**

Total grain storage capacities of all off-farm storage facilities in Ohio totaled 141 million bushels on Jan. 1, 1965. Capacities were first published in January 1961 for Ohio and the United States. Between that date and January 1965 the total capacity in Ohio increased 12 percent while the United States capacity increased nine percent. The amount of grain stored in Ohio is shown quarterly under each repective crop for the period 1960-1965. It is combined with farm storage to present the total grain on hand for the period.

1965	21,500	20,000	2,800	56,000	2.85	1596

1/ Ear corn; 70 pounds to a bushel.

2/ Practically all production sold from farm.

3/ Value of sales practically same as value of production.

FRUIT PRODUCTION:

The index of fruit production (1947-49=100) dropped from 115 percent in 1960 to the record low of 51 percent in 1963 due to an extremely cold winter and freezing temperatures as late as May 24, 1963. Freezing temperatures on May 10, 1965 again lowered the index below the 1947-49 base to 95 percent. Apple production ranged from the low of 84.7 million pounds in 1963 to the high of 165.1 million pounds in 1960. Value of apples produced ranged from the low of 4.9 million dollars in 1963 to 7.8 million dollars in 1960. Peach production was the hardest hit by the severe cold winter of 1962-63 which not only lowered the 1963 production to the record low one million pounds, but killed trees and lowered potential production for several years. The highest peach production during the 1959-65 period was recorded in 1960 with a total of 50 million pounds. The value of peaches produced ranged from the low of \$76,000 in 1963 to the high of nearly 3 million dollars in 1960.

Tart cherry production ranged from the low of 250 tons in 1963 to the 1964 high of 2400 tons. The price per ton of cherries varied from the 1964 low of \$132 to the 1960 high of \$200 per ton. The 1961 tart cherry crop had the largest total value of \$430,000 while the 1963 crop of \$55,000 was the lowest. The 1963 crop was also the record low for grape production with only 9500 tons produced. The 1965 grape crop was the largest during the 1959-1965 period at 21,500 tons. The price per ton of grapes ranged from the 1962 low of \$112 to the 1963 high of \$153 per ton.

^{1/} Survey averages from a 1965 survey of commercial orchards. These data should not be compared to official estimates or census totals.

VEGETABLE PRODUCTION:

The index of vegetable production in 1965 was 146 percent of the 1947-49 base. This was 13 percentage points above the 1959 index, and 27 points above the 119 percent recorded in 1964, the lowest production index during the 1960-1965 period. Cash receipts from vegetables and melons totaled 61.4 million dollars in 1965, 27 percent above the 1959 receipts. Lowest cash receipts for this group were recorded in 1961 at 48.1 million dollars. Tomatoes for processing accounted for the largest share of the vegetable cash receipts, with the 1965 crop having a total farm value of 15.6 million dollars. This was nearly twice the value of the 1959 crop, due mostly to a higher yield per acre and an increase of \$3.10 per ton in the season average price. Other vegetable crops which showed large increases during the 1959-1965 period were dry onions and cucumbers for pickles. Acres of dry onions harvested increased only 50 acres from 1959 to 1965, but the yield per acre jumped from 245 hundredweight in 1959 to 510 hundredweight in 1965. The 1965 farm value of dry onions at \$710,000 was well above the 1959 low of \$305,000, but was 14 percent below the high of \$828,000 reached in 1961. Production of cucumbers for pickles more than doubled from 1959 to 1965 due to an 1,100 acre increase in acreage harvested and nearly a ton increase in the yield per acre. The farm value of cucumbers for pickles ranged from the 1960 low of \$339,000 to the 1965 high of \$962,000.

The honey and beeswax estimates for 1955 through 1964 have been revised in conjunction with the 1964 Census review of all commodities. No data on the number of colonies or honey production were available from the 1964 Census of Agriculture. Information on State inspections and registrations, reports from commercial honey buyers and packers, and other information which became available after the original estimates were made necessitated revising estimates for all or part of the 1955-1964 period.

LIVESTOCK PRODUCTION

Cash receipts from livestock and livestock products increased 16 percent from 1959 to the 1965 high of 671.5 million dollars. This accounted for 60 percent of the total cash receipts from all commodities in 1965. Cash receipts from meat animals increased 26 percent from 1959 to 1965, and the 1965 total of 359.5 million dollars accounted for nearly one-third of the cash receipts from all commodities. Cash receipts from cattle and calves accounted for the largest share of the meat animal total at 178.2 million dollars in 1965, which was 25 percent above the 1959 total. Cash receipts from hogs was a close second with 166.4 million dollars in 1965, 21 percent above the 1959 total. Pounds of cattle and calves produced ranged from a low of 615.2 million pounds in 1959 to the high of 662.3 millions pounds in 1964. Pounds of hogs produced increased from 882.7 million head in 1960 to the high of 932.0 million pounds in 1962, and decreased to the low of 791.8 million pounds in 1965.

DAIRY:

The number of milk cows on farms declined steadily during the 1960-1965 period. The annual average number of milk cows was 687,000 head during 1960. This number decreased at an increasing rate for each of the following years. The 1961 number of milk cows was down two percent from the previous year, the 1962 number was three percent below 1961, the 1963 number at 622,000 was four percent below 1962, and the 1964 average was five percent below 1963. The 1965 number of cows at 555,000 was six percent below the 1964 average and was 19 percent below the 1960 average. Milk production per cow, on the other hand, increased each year during this same period from 7,460 pounds per cow in 1960 to 9,370 pounds per cow in 1965. This represents a 26 percent increase during the six year period, and as a result the 1965 total milk production was above the 1959 production by one percent as the increased rate of production more than offset the decline in milk cow numbers. However, 1965 production was four percent below the 1962 total of 5.4 billion pounds which was the high production for the six year period. Cash receipts from marketings of milk and cream totaled 217.0 million dollars in 1965, down from the high of 219.6 million dollars in 1961, but five percent above the low of 206.4 million dollars in 1960.

1/ Data include both farm and commercial operations.

2/ For number of head the sum of losses, sales, home consumption, and on hand end of year equals the number raised and on hand beginning of year.

3/ Loss during year of chickens on hand January 1.

4/ Does not include young chickens lost.

5/ Production is the quantity available for utilization during the year, i.e., sales plus home consumption plus or minus the change in inventory.

6/ Sold for slaughter.

7/ Consumed in the household on farms where produced.

Prices: The average annual price per pound of turkey live weight is computed from monthly prices per pound received by farmers, weighted by the estimated pounds sold each month.

Average Weight per Turkey Sold: The average live weight of turkeys sold is estimated from the average weights of turkey hens, toms, and fryer-roasters sold during the year as reported by turkey producers and from average weight per bird reported by slaughter plants.

Gross Income: Gross income from turkeys is computed by multiplying the yearly total pounds of turkeys sold by the estimated annual price per pound received by farmers. Gross income includes a small allowance for value of turkeys consumed in farm households where produced.

The State Is the Campus for Agricultural Research and Development

Ohio's major soil types and climatic conditions are represented at the Research Center's 12 locations. Thus, Center scientists can make field tests under conditions similar to those encountered by Ohio farmers.

Research is conducted by 13 departments on more than 6200 acres at Center headquarters in Wooster, ten branches, and The Ohio State University.

Center Headquarters, Wooster, Wayne County: 1953 acres

Eastern Ohio Resource Development Center, Caldwell, Noble County: 2053 acres

Jackson Branch, Jackson, Jackson County: 344 acres

Mahoning County Farm, Canfield: 275 acres

Muck Crops Branch, Willard, Huron County: 15 acres

North Central Branch, Vickery, Erie County: 335 acres

Northwestern Branch, Hoytville, Wood County: 247 acres

Southeastern Branch, Carpenter, Meigs County: 330 acres

Southern Branch, Ripley, Brown County: 275 acres

Vegetable Crops Branch, Marietta, Washington County: 20 acres

Western Branch, South Charleston, Clark County: 428 acres
